

ABOUT ALMONTY INDUSTRIES

Almonty specializes in acquiring distressed and underperforming operations and assets in tungsten markets. These then benefit from the company's in-house operating experience and unrivalled expertise.

Highly regarded as a hands-on, turnaround investor operator, Almonty is an expert at overseeing projects regarded as too complex or difficult for the average, pure 'financial investor'.

Almonty is actively pursuing other growth opportunities via acquisitions where it can apply its tungsten expertise to create additional value for all stakeholders. To date, the results of its acquisitions have been fast and very profitable turnarounds.

ALMONTY KOREA TUNGSTEN (SANGDONG MINE)

Almonty, through its wholly-owned subsidiary, Woulfe Mining Corp, owns a 100% interest in the Almonty Korea Tungsten Project (AKT) located in South Korea. The Almonty Korea Tungsten deposit (Sangdong Mine) hosts one of the largest tungsten resources in the world. AKT was the leading global tungsten producer for more than 40 years and it has the potential to produce 50% of the world's Tungsten supply (ex-China output). Almonty's Sangdong Mine Project is becoming a hot topic for resource experts, miners, investors, shareholders and other interested parties around the globe. Almonty recently completed its Pilot Plant at Sangdong Mine and site construction of production facilities is underway. Almonty's commitment to economic and community development will surely contribute to guiding the "Pride of Korea" back on track.

LOS SANTOS MINE / VALTREIXAL PROJECT

Almonty acquired the project in September 2011 and has been focused on utilizing its expertise in order to optimize operations, reduce costs and improve the tungsten recovery rate. To date Almonty has achieved an approximate 50% recovery rate of WO3 from its tailings retreatment as a result of continuing tests and trials, a substantial improvement from the 35-40% recovery rate attained in the initial stage of tailings retreatment. The Company continues to improve and increase its knowledge in the area of tailings reprocessing which further demonstrates Almonty's commitment to invest in tungsten technologies which is paramount to remain competitive. / Almonty Industries Inc. currently owns 100% of the Valtreixal Sn-WO3 project in North Western Spain (approx. 250km from Los Santos Mine)

PANASQUEIRA MINE

Almonty, through its indirect wholly-owned subsidiary, Beralt Tin and Wolfram (Portugal) SA ("Beralt"), owns a 100% interest in the Panasqueira Tin Tungsten mine located in Covilhã (Village of Panasqueira), Portugal.

To date, a second tailings dam at Panasqueira has been completed which will enable Panasqueira to process and store tailings for another 6 years at the rate of 800,000 ton mining per annum. In addition to the application of stringent safety standards in the engineering, the new tailings dam is designed for the second phase expansion for an additional 4 years by placing a surrounding 10 meter height retaining wall. A further phase three is now planned to increase capacity by a further 10 years. Thus, a total of 20 years additional capacity is anticipated after the completion of all three phases.

ABOUT TUNGSTEN

Due to the unique properties of tungsten, tungsten alloys and some tungsten compounds, tungsten cannot be substituted in many important applications relevant to modern technology. Tungsten is an additive in the production of specialist steel; filament wire for lighting (2%); and specialty uses for mobile phone handsets, military, ballistics and more. Today, manufacturing cemented carbides is the main use of tungsten. Cemented carbides, or hard metals, are materials made by "cementing" very hard tungsten monocarbide (WC) grains in a binder matrix of tough cobalt metal by liquid phase sintering. This results in hardness close to that of diamonds.
